

COMPUTER SYSTEMS ASSIGNMENT PR UT1

OCCUPATIONAL GENERAL AND ELECTRICAL RISKS

So Hee Park

1.- Define occupational risk prevention using your own words.

Occupational risk prevention means what we can do to avoid accidents or dangerous events from happening during work. It includes identifying the risks and taking preventive measures so that we can minimize or eliminate the risks from occurring.

2.- Name 3 rights and 3 obligations for workers, regarding occupational risks

The three rights of workers regarding occupational risks are as following.

1. First, the employer must tell you the risks beforehand, and what you should do if the event happens.
2. Second, the worker has the right to acknowledge the other companies risks as well, and their preventive measures.
3. Third, in case of emergency, the worker should be able to stop and leave the site.

The workers have obligations as well.

1. First, the worker should report any risks about his work to others.
2. Second, when informed, the worker should listen and follow the safety information.
3. Third, the worker should comply with the safety rules provided by the employer.

3.- Define risk assessment and prevencion10.es, and give some details.

Risk assessment is the process of evaluating what kind of risks your work can have, including the possibility of occurring and the seriousness of the danger.

[Prevencion10.es](https://prevencion10.es/) is a free online service to help self-employed workers and small companies to manage safety at work. It has four main functions.

- Beginning with Evalua-t, which help companies carry out a risk assessment with questionnaires.
- Autopreven-t is for self-employed workers and to provide safety when working with other companies.
- Instruye-t is an online training course for learning about safety precautions.
- Last, there is Stop Riesgos Laborales which is a phone number for workers to ask questions and ask for technical help.

4.- Define electrical risk using your own words.

Electrical risk is any risk directly or indirectly by electricity. It encompasses a wide range of electrical damage from electric shocks and burns, fires, explosions and even death provoked by electricity. It can be caused by environmental factors such as cramped and wet space, and also equipment factors like using a wet electricity tool.

5.- Name 5 common electrical risk control measures.

There are several electrical risk control measures.

1. First, only professionally trained electricians should be able to carry out work related to electricity.
2. Second, as equipment is closely linked to electrical risks, workers should be provided safe and adequate equipment.
3. Third, before starting work, both environment and equipment should be checked thoroughly so that it does not contain dangerous materials such as lead, and remove them.
4. Also, a sufficient amount of power socket outlets should be provided as overloading the socket outlets is a typical electric accident.
5. Last, adding to the socket outlet mentioned before, the power circuit should have a preventive measure, with the help of appropriate rated fuse and circuit breakers. These methods will prevent overloading the power circuit by cutting off electricity when the circuit is overloaded.

6.- Define hostile operating environment, using your own words.

A hostile operating environment refers to a dangerous environment that has a high probability of damaging or causing accident in an equipment. More specifically, it would mean environments with high levels of moisture, heat, vibration, chemicals and dust, which does not help the maintenance of equipments.

7.- Define RCDs and explain their purpose.

RCD stands for "Residual Current Device", which is designed to help electric workers from getting a fatal electric shock. It protects workers from accidents such as touching a bare wire, and also can protect electrical fires.

8.- Ergonomics in computer systems: Indicate which aspects are not 100% satisfactory in your workspace.

In computer systems, we need to sit straight with hips far back to the chair and maintain some distance from the monitor. However, I have a very uncomfortable chair, and when I am debugging, I tend to lean closer to the monitor to see better, which is not ergonomically correct. I also have a bad habit of crossing my legs when I am seated for a long time, which is very damaging to the spine and hips. This black Friday I want to buy myself a new chair so I can code both physically and mentally happily!

9.- Colours of electric wires: Colours and explanation you find in a ceiling lamp in Madrid.

A ceiling lamp would have the standard wire colours for the flexible cable. As Madrid is part of the European Union, it would have colour brown for phase conductor, blue for neutral conductor and green and yellow wire for the protective earth/ground cable.

10.- Taking into account the types of fires, indicate which could be extinguished by the extinguisher system you have in your classroom corridor. Explain.

In a Clara Del Rey classroom, the type of fire we would have would be from ordinary combustibles such as wood, paper and cloth. Therefore, the extinguisher in a classroom would extinguish type of **fire A**.
